# 1.What is the Internet?

The Internet is a vast network that connects computers all over the world. Through the Internet, people can share information and communicate from anywhere with an Internet connection.

## 2. Who invented the Internet?

The Internet consists of technologies developed by different individuals and organizations. Important figures include Robert W. Taylor, who led the development of the ARPANET (an early prototype of the

Internet), and Vinton Cerf and Robert Kahn, who developed the Transmission Control Protocol/Internet Protocol (TCP/IP) technologies.

### 3.How does the Internet work?

The Internet works through a series of networks that connect devices around the world through telephone lines. Users are provided access to the Internet by Internet service providers. The widespread use of mobile

broadband and Wi-Fi in the 21st century has allowed this connection to be wireless.

## 4. Is the Internet dangerous?

The advent of the Internet has brought into existence new forms of exploitation, such as spam e-mail and malware, and harmful social behaviour, such as cyberbullying and doxxing. Many companies collect extensive information from

users, which some deem a violation of privacy.

## 5.What is the Dark Web?

The Dark Web refers to a series of Web sites that require special decryption and configuration tools to access. It is most commonly used for purposes that require strict anonymity, including illegal sales (e.g., of weapons and

drugs), political dissent in  
countries with heavy  
censorship, and  
whistleblowing.

## 6. Who controls the Internet?

While the Internet is theoretically decentralized and thus controlled by no single entity, many argue that tech companies such as Amazon, Facebook, and Google represent a small concentration of

organizations that have unprecedented influence over the information and money on the Internet. In some countries, certain parts of the Internet are blocked via censorship.
